

Built for AEC professionals by industry experts, OpCenter Build is a SaaS solution for the AEC industry to expedite close-out delivery, reduce unnecessary expenditures on a project, and improve collaboration with all relevant stakeholders to more effectively deliver projects on-time and on-budget. With OpCenter Build you and your project team are provided with local Construction Information Managers (CIMs), skilled in document management and CDT certified, to assist you throughout the project from Design to Close-out and beyond.

Your Local CIM Experience

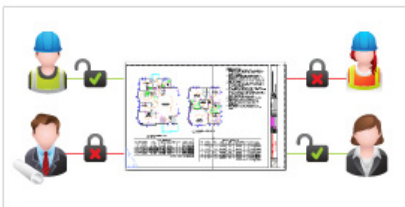

Before construction begins your local CIMs meet with you and key stakeholders, face to face to discuss your unique requirements, configure the workflow of project-critical documents, and provide all users/members with in-depth training.

CIMs sit down with your team to address roles and permissions of all project team members, build out the workflow in accordance with contract specifications including which items to track (RFIs, change orders, submittals, etc.) and provide initial and ongoing support for the life of the project.

We believe you should have access to CDT certified local CIMs, throughout the project life-cycle, to provide your team with assistance, from right down the street to ensure you deliver close-out in days instead of weeks or months. That's Your Local CIM Experience.

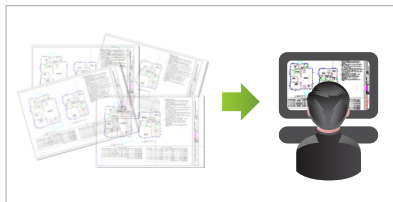

Permission Control

You have full control over project critical construction documents with advanced permission options, the ability to assign roles and monitor activity logs for the entire team.

Archiving & Close-Out

Once you've completed a project in OpCenter, we simply store it in an online archive or we can create a backup, as an off-line digital folder with all files, file structure, and tracking history just as you had left it.

Secure Project Data

OpCenter Share is hosted at a world premier enterprise-class hosting facility. Redundant servers, encrypted data transmission, data backup, and 24x7 monitoring keeps your valuable information secure.

"OpCenter Build is easier to use than FTP. It is easy to setup projects and restrict access to certain documents. People only see what we want them to see." -Rob Uhrin, Architect / Partner at Cooper Carry
